

PUNCHLINE

Twist the words. Light the page. Change the ending.

DRAFT / TEAM DETAILS PENDING

3D POP-UP COMIC / DESKTOP BROWSER / 10-15 MINUTES

Comic panels unfold into small playable **3D city dioramas**. You are **Snap**, a background character with a flash camera. Twist printed **BAM!** signs, position yourself or a prop in their burst zone, then flash to make the effect physically happen. Use depth and height to escape the panels and redirect the villain's final punch.

AI-generated art-direction mockup. Gameplay is planned; this is not an implemented scene.

1 TWIST

Turn the printed sign in quarter steps. Its arrow shows where the force will go.

2 LIGHT

Aim the camera at the sign, then flash to activate it.

3 LAUNCH

Send Snap onto a raised ledge, or shove a prop across the 3D set.

THE PLAYER LOOP

Aim. Select a visible sign within camera range; solid obstacles block targeting. **Twist.** Turn it in quarter steps within its visible rotation ring: vertical rings offer upward/sideways launches, while horizontal rings push across the room. **Flash.** Snap and crates in the outlined zone receive a fixed, capped impulse along its arrow. **Advance.** Reach a ledge, trigger a switch or open the next panel.

Authored room cameras and broad landings keep depth readable. Sound words provide the jump. Flashes recharge automatically. Failed launches return to the panel checkpoint; one-button reset restores the entire room.

THREE THEMES INSIDE THE SAME MECHANIC

COMIC	Printed onomatopoeia becomes an interactive 3D object inside folded-paper sets. Ink and speech bubbles carry the presentation.
TWIST	Quarter-turn rotation changes force direction. The finale turns a finishing blow into the player's escape.
LIGHT	The camera flash activates the selected word. Aiming identifies the target; it stays inert until the light pulse.

A SHORT ARC WITH A PLAYABLE PAYOFF

Eight 3D challenges across three pages. Learn launch; rotate to cross a gap; move around an obstruction; shove a crate onto a switch; reach another burst zone; combine two words across raised ledges; solve an order-dependent escape; redirect the villain's large BAM! in the finale. Short dialogue adds humor. The ending recombines established rules.

Controls: WASD/arrows - move across the room; mouse - aim; Q/E - rotate; click or Space - flash; R - reset; Escape - pause. Room cameras are authored.

A complete game in 100 hours

A focused core, five owners, early browser testing and a protected release buffer.

TEAM - REQUIRED DETAILS STILL INCOMPLETE

COMMITTED SCOPE

One protagonist, a reusable **3D pop-up city kit** and one rotatable sound-effect system; crates, switches, doors and static hazards; eight rooms with authored cameras, a playable finale and credits; recovery, reset, pause and sound controls; a public browser build. Optional extras: cosmetic animation, dialogue and replay statistics. Open-world traversal, free camera control, combat, enemy AI, procedural generation and multiplayer are outside scope.

BUILD AND DELIVERY GATES - FROM OFFICIAL HOUR 0

Planned tool: Godot 4 / GDScript, Compatibility renderer, single-threaded web export. Game code, mechanics and architecture begin in the official window. **Five owners:** 3D movement/camera/integration; targeting/force; levels; 3D art/UI; audio/release testing.

HOURS	REVIEWABLE DELIVERABLE
0-8	One 3D room with launch, rotation, flash, reset and tested web export.
8-24	Complete core loop and shared components; early hosted build.
24-48	Eight challenges assembled; art and sound integrated.
48-64	Beginning-to-credits run, including the playable finale.
64-82	Fresh-player tests; tune clarity, difficulty and 10-15 minute duration.
82-92	Feature freeze; browser/machine tests; fix completion blockers.
92-100	Final release, documentation and submission buffer.

PRESENTATION AND VALIDATION

Folded-paper 3D scenery, expressive poses, ink contours, orange signs and cyan light; impact bursts and short page transitions provide spectacle. Reuse models and budget effects for browser performance. Reduce flash/shake if desired. Test the hosted build on Chromium, Firefox and Safari; observe at least five uncoached first playthroughs, targeting a typical 10-15 minute completion.

ASSETS, AI AND SUBMISSION

Use original, free/open-source, AI-generated or permitted CC assets only; record external sources/licenses in **CREDITS.md** and on itch.io.

Codex/ChatGPT assisted design and drafting; **OpenAI ImageGen** made the concept illustration. Humans own final choices; disclose further AI use. The public repo has an MIT license and proposal; add the playable itch.io link and setup steps to README before final submission. Complete registration, team-thread membership and the official form by their deadlines.

DRAFT: fill team name, track and four member records; obtain team review and confirm the official final deadline before submission.
